Branch class	5
Item class	5
Computer class	6
PeripheralDevice class	6
Keyboard class	6
Mouse class	6
Methods	7
<b>Evaluation</b>	7

## Introduction

1. Try to provide clear and careful solutions.
2. You should provide comments for your code so it will be completely clear what you are trying to achieve. WARNING! Lack of comments might lead to points reduction.
3. Please note the following few points which may lead to points reduction during the submission check:
  - (a) Avoid using *magic numbers*. For example: “if (i>17)”, 17 is a magic number. If 17 is representing, for example, the number of shoes, then instead you should write: “if (i>shoesNumber)”.
  - (b) Try to avoid code duplication as much as possible.
  - (c) You should not globally enable *std* namespace usage or any other namespaces, e.g. *using namespace std;*

## Definitions

### Read carefully!

For the third homework, you will work with the Inheritance mechanism in C++, the relevant tutorials are 1 to 8.

In this assignment you will model and implement KSF's store software.

KSF is a new chain store brand, that currently sales computers and computer equipment, but has serious future plans on expanding its selection of items, so they asked you that take that in account when creating the software.

Like in the last assignment, The methods signature is up to you, but :

1. Use the **const** keyword where possible and needed.
2. Create **getters** and **setters** for all private fields
3. Use the **friend** functions where needed.
4. Use **reference** variables where possible and needed.
5. Use **static** variables and functions where possible and needed.
6. Use **virtual functions** where it is right to do so.
7. Use **Abstract base classes** where it is right to do so.

Your goals are:

- Having the main files, you should provide declaration and implementation while keeping in mind the basic *OOP* concept of *encapsulation*.

**Keep in mind that the included main files are very basic and do not cover all possible scenarios and end cases.**

- Take care of correct dynamic memory management. Be aware of both allocating and releasing resources.

☒ In this submission, you are **RESTRICTED** from using *STL* library regardless of prior knowledge you have.

☒ You **can** assume that the input for the functions you write will be legal

## Branch class

Each of KSF's branches are going to have:

- catalog - An Array of Item pointers, the store's item catalog
  - The array should have the defined size – `BRANCH_SIZE` in the `Branch.h` file , should be 10 as default.
- location
  - Represented by a string
- Add item function
  - Adds a new item to the store
  - If the store is full, throw away the oldest item in the store and insert the new item at its place
    - i. Oldest as in the first to be the added to the store from the current catalog

## Item class

Each item has the following attributes:

- price
  - Represented by an int
- manufacturer
  - Represented by a string
- id
  - Represented by an int
  - The first id is 1, each item is given the next free id (the last id given +1)
  - The Id should never change once given to an item
- To string conversion function ( cast to string operator overload)
  - Should return a string with the item id, manufacturer and price with a comma between them.
  - Please note that sub-classes of Item might need to override this conversion, and add extra details of the **Is-A Item** to the string, as you can see in the `main_output.txt`. Beware of unnecessary code duplication.
  - For example :

id	2
Price	60
Manufacturer	Dell

Should return the string :

id 2: Dell, 60\$

- Destruction instructions:
  - When item is destroyed, print the following:

Throwing away an item

## Computer class

Each computer **Is-A** Item and also has the following attributes:

- cpu
  - Represented by a string
- Is a laptop (isALaptop)
  - Represented by a bool

## PeripheralDevice class

Each PeripheralDevice **Is-A** item and also has the following attributes:

- color
  - Represented by a string
- Is wireless (isWireless)
  - Represented by a bool
- Connect function
  - Takes a computer as argument, and prints :

```
*string(device) * is connecting to  
computer : *string(computer) *
```

- It shouldn't do anything but print

## Keyboard class

Each keyboard **Is-A** PeripheralDevice and also has the following attributes:

- number of keys (numberOfKeys)
  - Represented by an int

## Mouse class

Each mouse **Is-A** PeripheralDevice and also has the following attributes:

- dpi
  - Represented by an int

For int to string conversion, I recommend you use `std::to_string` function that comes with `<string>`.

There is no need in this assignment for default constructors.

## Methods

Note that you are required for a getter/setter for **every** private field.

There is no need to implement

- catalog setter in Branch
- Copy constructor for Branch
- Assignment Operator for Branch
- setId for Item

## Evaluation

Homework exercise provided with the following example program files and corresponding outputs:

1. main.cpp
2. main\_output.txt

You should be able to compile your code with “main.cpp” and receive the correct output in “main\_output.txt”.

Submission should only include the following files :

Branch.h/.cpp  
Item.h/.cpp  
Computer.h/.cpp  
PeripheralDevice.h/.cpp  
Mouse.h/.cpp  
Keyboard.h/.cpp

**Make sure you keep the C++ syntax convention and submit the files exactly as described in the “Oop – Cpp – Conventions and Requirements” file in Moodle.**

**GOOD LUCK! 😊**
